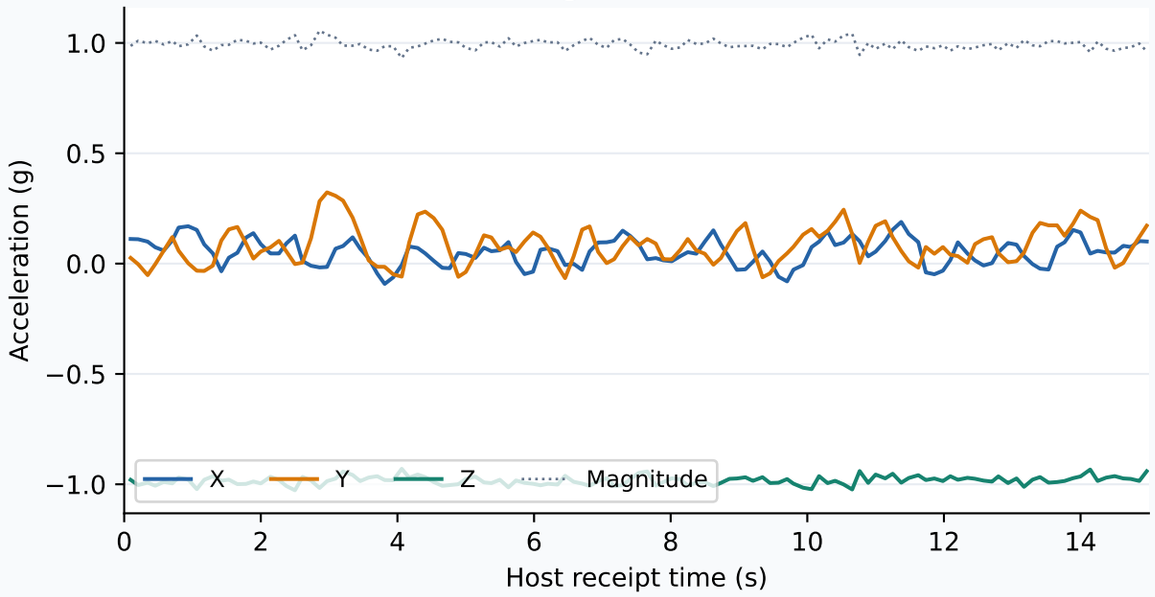
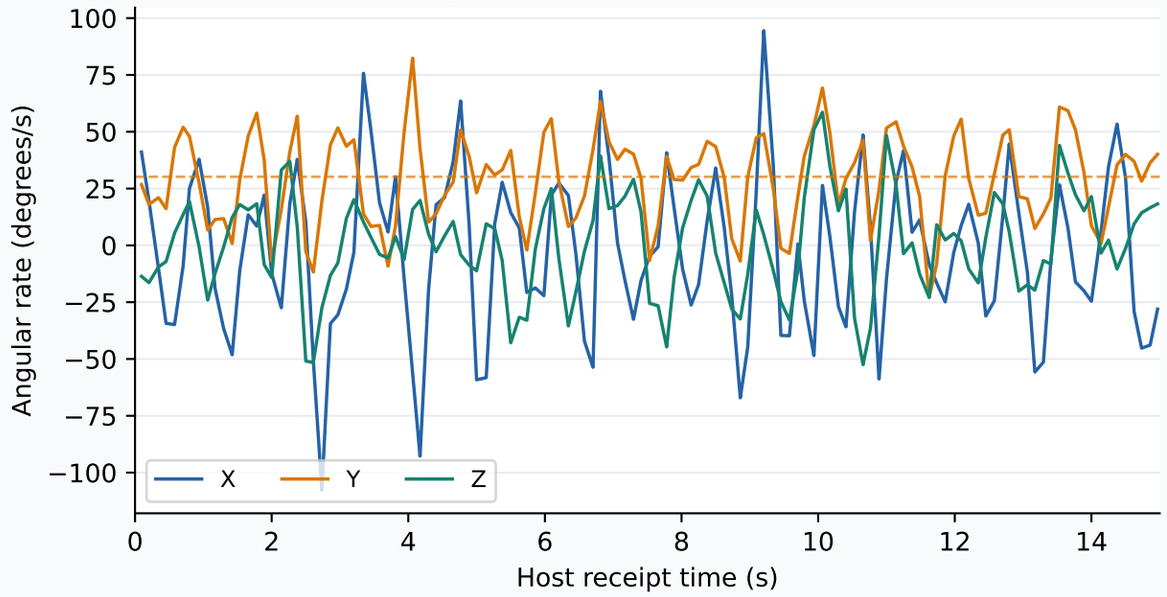
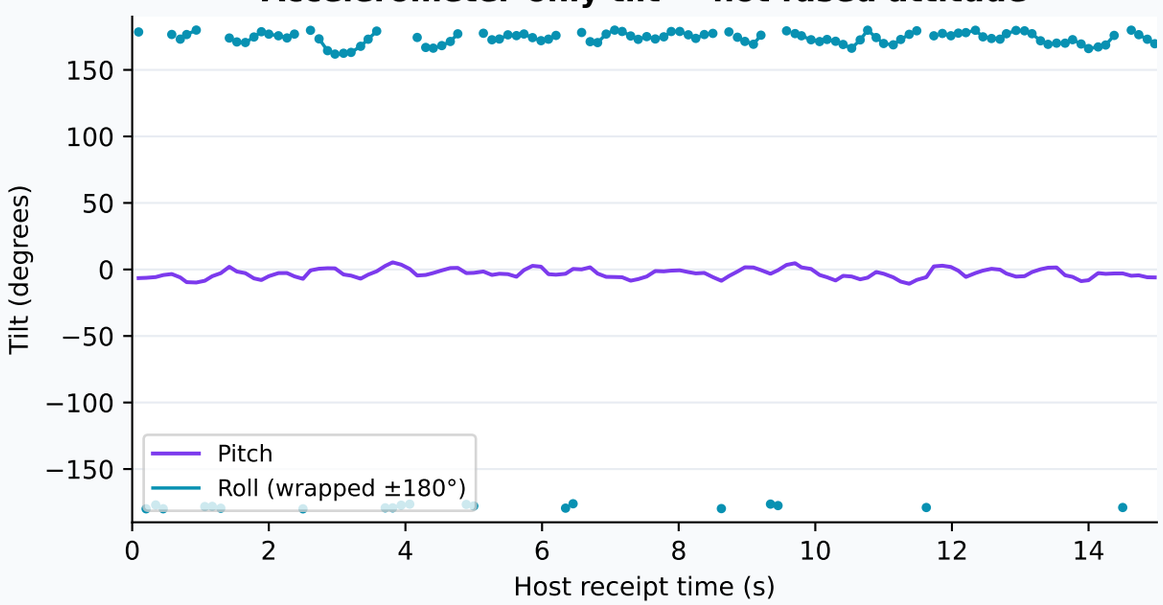
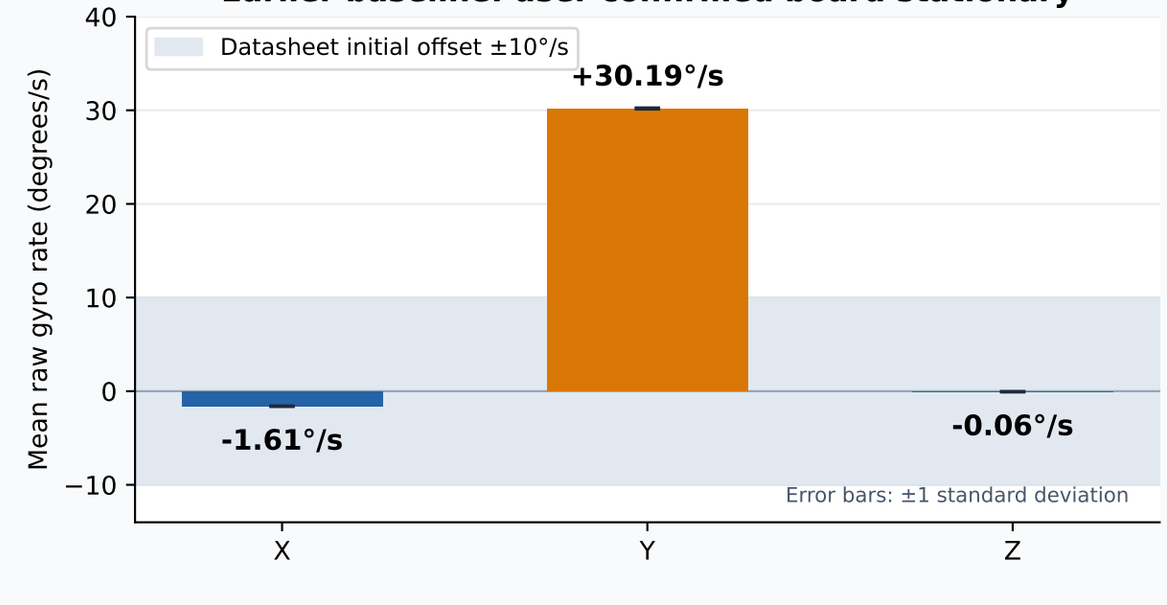
Onboard IMU: motion response and stationary gyro offset

QMI8658C | Oct 31, 2026 · 10:48 PM EDT | 125 valid readings / 0 rejected | sensor-native axes









Key finding: stationary Y gyro = +30.19°/s. Motion response is present; calibration/accuracy remains unresolved.

No bias correction or smoothing applied. Roll lines break at angle wrap; tilt may be absent under acceleration.

Time is host receipt time (~8 observations/s), not the sensor ODR. The first, separate attempt stopped on saturation.
